

Her axial back pain is greatly improved, but not completely eradicated. There is absolutely no surgery at this point in time that would be beneficial for her axial back pain due to her lumbar internal disc disruption.,PAST MEDICAL HISTORY:, Significant for anxiety disorder.,PAST SURGICAL HISTORY: , Foot surgery, abdominal surgery, and knee surgery.,CURRENT MEDICATIONS:, Lipitor and Lexapro.,ALLERGIES: , She is allergic to sulfa medications.,SOCIAL HISTORY: , She is married, retired. Denies tobacco or ethanol use.,FAMILY HISTORY:, Father died of mesothelioma. Mother gastric problems.,REVIEW OF SYSTEMS: , No recent history of night sweats, fevers, weight loss, visual changes, loss of consciousness, convulsion, or dysphagia. Otherwise, review of systems is unremarkable, and a detailed history can be found in the patient's chart.,PHYSICAL EXAMINATION:, Physical exam can be found in great detail in the patient's chart.,ASSESSMENT AND PLAN: ,The patient is suffering from multilevel lumbar internal disc disruption as well as an element of lumbar facet joint syndrome. Her lumbar facet joints were denervated approximately 6 months ago. The denervation procedure helped her axial back pain approximately 40% when standing. With extension and rotation it helped her axial back pain approximately 70%. She is now able to swing a golf club. She was unable to swing a golf club due to the rotational movements before her rhizotomy. She is currently playing golf. Her L4 radicular symptoms have resolved since her therapeutic transforaminal injection.,I am going to have her

fitted with a low profile back brace and I am starting her on diclofenac 75 mg p.o. b.i.d. We will follow her up in 1 month's time.,
